The purpose of Bare Back belts is to lower the coefficient of friction for operation in slider bed applications. Belts with bleed through or rubber residue on the fabric side decrease the effectiveness of bare back belt. This increases the drag / resistance the belt is under, causing motors to work harder to move the belt.

Call RPI for Bare Back belts that don’t need a wax job!

GO BARE BACK!

When you go bare, go all the way bare! RPI Bare Back belts don’t have unsightly bleed through!
